

control 1: probability-flow ODE from the same x_t to $s = 0.4502$, 2 repeated runs (max |diff| = 0.00e+00)

control 1, Tweedie-denoised

control 2: the same rollouts stopped at $s_{\text{near}} = 0.5798$ ($\sigma = 4.3$), raw

control 2, Tweedie-denoised
