

$p_{\theta}(x_s | x_t)$: reverse_diffusion (reverse SDE, no corrector), 299 steps, 299 NFE per rollout

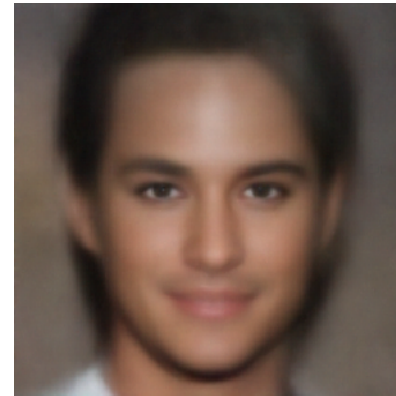

x_0 (validation-00000-of-00001.parquet#row0)

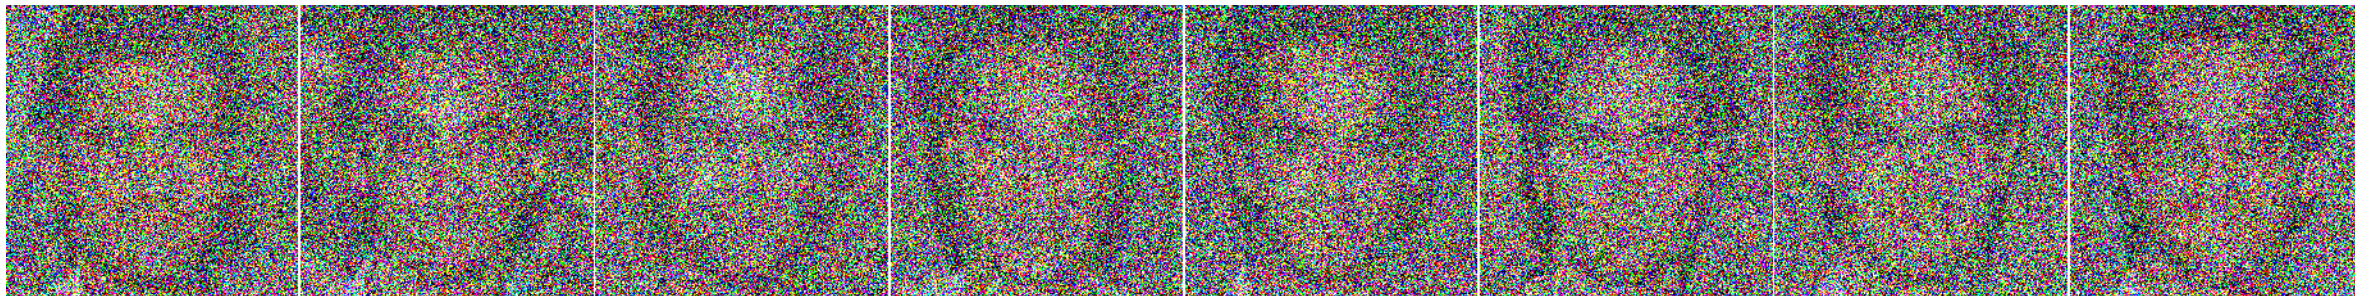

frozen x_t , $t = 0.5998$, $\sigma_t = 5.3$
(forward-noise seed 0)

$E_{\theta}[x_0 | x_t]$ (Tweedie, 1 NFE)

8 independent stochastic rollouts from the SAME x_t to $s = 0.4502$ ($\sigma_s = 1.11$); raw $x_s^{(i)}$, seeds 1000..1007

the same $x_s^{(i)}$, each shown through $E_{\theta}[x_0 | x_s^{(i)}]$ (Tweedie, 1 NFE each)
